

What would be the hurdles for UTM service? 03

June 2, 2021

Matthew Satterley, Benoit Curdy*

There is a strong parallel between ATM and UTM. The U-Space regulation specifies what conditions U-Space service providers must fulfil to become validated. The small print of these conditions, currently under development, will determine the exact safety assessments and monitoring.

Concrete expertise shows the way towards the practical implementation of U-Space and of UTM in general. The expertise on the practical use of standards turns a painful process into a smooth automated process. National authorities keep control as they control the tokens that USSPs need to function.

The whole UTM discussion is, at least in Europe, moving from technical and regulatory issues to market issues: fair competition and customer services. Fairness can only gain from global harmonization.

The EASA presentation, together with the speakers' information of this "Approval Requirements for a UTM service supplier", can be found [▶ here](#).

GUTMA Members can access the recordings of the webinars [▶ here](#) and the other presentations [▶ here](#).
